New High Speed/High Capacity Wireless Network Installed at St. Mary's School in Okotoks

Okotoks, Alberta - St. Mary's School has become one of the first schools in Canada to begin using a new wireless networking technology from a company called Meru Networks.

By using Meru's wireless technology, the school will be able to support large numbers of simultaneously connected notebook computers (and other wireless devices) without experiencing any significant system slowdowns. Eventually, all schools and division offices in Christ the Redeemer Catholic Schools will use this new technology from Meru Networks.

Vincent Van Hyfte, the Director of Technology for Christ the Redeemer Catholic Schools, indicated that his department studied many different wireless products from other companies. However, after extensive research, the choice became very clear. Van Hyfte further commented that, "We contacted several educational organizations in both Canada and the U.S. that had switched to Meru from other wireless companies. Site visits were also conducted so that we could actually see if the performance values were true. Needless to say, that after seeing the results, the choice was very easy. Meru Networks simply offers the fastest and highest capacity wireless networking product. Furthermore, while many other school divisions in the province are just now completing their wireless network installations, Christ the Redeemer Catholic Schools is starting to upgrade to the best of the next generation of wireless that will better support students, parents and teachers for years to come."

Meru Networks is currently the fastest growing wireless LAN company in the world and recently entered the Canadian market. Christ the Redeemer Catholic Schools is one of the first in Canada to start using their technology.
